

# COMP 2119A: Solution for Assignment 2

1

a) To reverse array of  $n$  numbers  $A[1, \dots, n]$ , can call reverse  $A[2, \dots, n-1]$ . The detail algorithm is shown in . Time complexity:  $O(n)$ .

---

**Algorithm 1** Reverse Array

---

```
1: procedure REVERSEARRAY(array  $A$ ,  $low$ ,  $high$ )
2:   if  $low == high$  then
3:     return  $A$ 
4:   end if
5:   if  $high - low == 1$  then
6:      $swap(A[low], A[high])$ 
7:     return  $A$ 
8:   else
9:      $reverseArray(A, low + 1, high - 1)$ 
10:     $swap(A[low], A[high])$ 
11:  end if
12: end procedure
```

---

b) The algorithm is shown in . Time complexity:  $O(\log n)$

---

**Algorithm 2** Find element

---

```
1: procedure FIND(array  $A$ ,  $low$ ,  $high$ )
2:   if  $low == high$  then
3:     if  $A[low] == low$  then
4:       return true
5:     else
6:       return false
7:     end if
8:   end if
9:    $mid = floor((low + high)/2)$ 
10:  if  $A[mid] \leq mid$  then
11:     $find(A, mid, high)$ 
12:  else
13:     $find(A, low, mid-1)$ 
14:  end if
15: end procedure
```

---

2

a) Use two loops to go through all situations and find the max one. The algorithm is shown in . Time complexity:  $O(n^2)$ .

---

**Algorithm 3** Max Value

---

```
1: procedure MAXVALUE(array  $A$ )
2:    $max = 0, maxI = 0, maxJ = 0$ 
3:   for  $i = 1, i \leq n, ++i$  do
4:     for  $j = i, j \leq n, ++j$  do
5:       if  $A[j] - A[i] > max$  then
6:          $max = A[j] - A[i]$ 
7:          $maxI = i$ 
8:          $maxJ = j$ 
9:       end if
10:    end for
11:  end for
12:  return  $max, maxI, maxJ$ 
13: end procedure
```

---

b) If the array's size is 1, then return 0. Otherwise, we can split the array in half and find the max of left half, right half and across two halves. The algorithm is shown in . Time complexity:  $O(n \log n)$ .

---

**Algorithm 4** Max Value Recursive

---

```
1: procedure MAXVALUEMIDDLE(array  $A$ ,  $low$ ,  $high$ ,  $middle$  )
2:    $MaxRight = A[high]$ ,  $indexRight = high$ ,  $MinLeft = A[low]$ ,  $IndexLeft = low$ 
3:   for  $i = low$ ,  $i \leq middle$ ,  $++i$  do
4:     if  $A[i] < MinLeft$  then
5:        $MinLeft = A[i]$ 
6:        $IndexLeft = i$ 
7:     end if
8:   end for
9:   for  $i = middle + 1$ ,  $i \leq high$ ,  $++i$  do
10:    if  $A[i] > MaxRight$  then
11:       $MaxRight = A[i]$ 
12:       $IndexRight = i$ 
13:    end if
14:  end for
15:  return ( $IndexLeft$ ,  $IndexRight$ ,  $MaxRight - MinLeft$ )
16: end procedure
17: procedure MAXVALUE(array  $A$ ,  $low$ ,  $high$ )
18:   ( $i1, j1, max1$ ) =  $maxValue(A, low, (low + high)/2)$ 
19:   ( $i2, j2, max2$ ) =  $maxValue(A, (low + high)/2 + 1, high)$ 
20:   ( $i3, j3, max3$ ) =  $maxValueMiddle(A, low, high, (low + high)/2)$ 
21:   if  $max1 > max2$  then
22:     if  $max1 > max3$  then
23:       return ( $i1, j1, max1$ )
24:     else
25:       return ( $i3, j3, max3$ )
26:     end if
27:   else
28:     if  $max2 > max3$  then
29:       return ( $i2, j2, max2$ )
30:     else
31:       return ( $i3, j3, max3$ )
32:     end if
33:   end if
34: end procedure
```

---

3

Firstly, move  $n$  red disks from 0 to 2 (using 0,1,2). Then, move  $n$  blue disks from 3 to 0 (using 0,1,3). Finally, move  $n$  red disks from 2 to 3 (using 1,2,3). The algorithm is shown in .

---

**Algorithm 5** TofH

---

```
1: procedure TofH(A,B,C,n)
2:   if  $n = 1$  then
3:     move disk from A to C
4:   else
5:     TofH(A,C,B,n - 1)
6:     move disk from A to C
7:     TofH(B,A,C,n - 1)
8:   end if
9: end procedure
10: procedure TofHDOULBE( $nR, nB, 0, 1, 2, 3$ )
11:   TofH(0,1,2, $nR$ )
12:   TofH(3,1,0, $nB$ )
13:   TofH(2,1,3, $nR$ )
14: end procedure
```

---

4

Assume that we have a stack  $S$ , we define a new stack  $S'$  whose elements are like  $(a1, a2)$  where  $a1, a2 \in S$ . The algorithm is shown in , while the Top and Pop are same as usual stack. The time complexity of four operations are  $O(1)$ .

---

**Algorithm 6** Stack

---

```
1: procedure PUSH( $S, a$ )
2:    $x = Top(S)$ 
3:   if  $x > a$  then
4:      $S'.push((a, a))$ 
5:   else
6:      $S'.push((a, x))$ 
7:   end if
8: end procedure
9: procedure FINDMIN( $S$ )
10:   $x = S'.Top()$ 
11:  return  $x.a1$ 
12: end procedure
```

---

5

a) Allocate a  $n * n$  matrix  $M$ , whose entries are set as 0. For any two vertex  $i$  and  $j$ ,  $M[i][j]$  equals to number of edges pointing from  $i$  to  $j$ . For vertex  $i$ : in-degree is sum of the  $i$ th row in  $M$ , and out-degree is the sum of the  $i$ th column. The time complexity is  $O(n)$ , since traverse one row or one column.

b) We can check  $M[i][j], M^2[i][j], \dots, M^n[i][j]$ . If there exist  $M^k[i][j] > 0$ , then  $j$  can be reached from  $i$  in the graph. Or you can use DFS or BFS to check if there is a path between  $j$  and  $i$ . The time complexity of DFS or BFS is  $O(n^2)$ .

c) We can use BFS with some starting vertex, e.g.  $s = 1$ . If the number of accessed vertexes during the search equals to  $n$ , then it is connected, else not. The algorithm is shown in . Time complexity is

$O(n^2)$ .

---

**Algorithm 7** BFS

---

```
1: procedure BFS( $M, s$ )
2:   queue Q
3:   visited[0,...,n-1]=false
4:   count=0
5:   visited[s] = true
6:   Enqueue(Q,s)
7:   while not(Empty(Q)) do
8:     s=Dequeue(Q)
9:     count++
10:    for  $i = 0, i < n, ++ i$  do
11:      if !visited[i] and  $i \neq s$  and  $M[i][s] > 0$  then
12:        Enqueue(Q,i)
13:        visited[i]=true
14:      end if
15:    end for
16:  end while
17:  if count == n then
18:    return true
19:  elsereturn false
20:  end if
21: end procedure
```

---

d) We can use DFS to travel the graph, and keep a record of the parent node of node  $i$ . The algorithm is shown in . Time complexity is  $O(n^2)$

---

**Algorithm 8** DFS

---

```
1: procedure DFS( $M, s, pre$ )
2:   visit[s] = true
3:   for  $i = 0, i \leq n, ++ i$  do
4:     if  $M[s][i] == 1$  then
5:       if !visit[i] then
6:         return DFS( $i, s$ )
7:       else
8:         if  $i \neq pre$  then
9:           return false
10:        end if
11:      end if
12:    end if
13:  end for
14:  return true
15: end procedure
```

---

6

a)

---

**Algorithm 9** EnhancedBFS

---

```

1: procedure ENHANCEDBFS( $s, n$ )
2:   queue Q
3:   int visited[1,  $\dots$ ,  $n - 1$ ] = {0,  $\dots$ , 0}
4:   Enqueue (Q,s)
5:   visited[s] = 1
6:   while Q not empty do
7:     i=Dequeue(Q)
8:     for each neighbour  $j$  of  $i$  do
9:       if visited[j]=0 then
10:        Enqueue(Q,j)
11:        visited[j]=1
12:        PREV[j]=i
13:      end if
14:    end for
15:  end while
16: end procedure

```

---

b)

---

**Algorithm 10** printv

---

```

1: procedure PRINT( $v$ )
2:   if  $v \neq s$  then
3:     if PREV[v] $\neq s$  then
4:       print(PREV[v])
5:       print v
6:     end if
7:   end if
8: end procedure

```

---

7

a) simple weighted graph (ABCD|| $\Phi$ )

b) each node represents a state of the situation (where the four people are), || denotes the river.

c) edges are the time required to move from one node to the next node

d) find the minimal weighted path in weighted directed graph from the original node (ABCD|| $\Phi$ ) to final state ( $\Phi$ ||ABCD)

Proof: Assume that we have  $0 \leq i, j \leq m-1, i \leq j$ , such that  $\frac{1}{2}i(i+1) \bmod m = \frac{1}{2}j(j+1) \bmod m$ .

That is to say,  $\exists k_1, k_2 \in Z$ , we have  $k_1m + \frac{1}{2}i(i+1) = k_2m + \frac{1}{2}j(j+1)$ .

Then, we can get that  $2(k_1 - k_2)m = i^2 + i - j^2 - j = (j-i)(j+i+1)$ .

1) When both  $i, j$  are even or odd, then  $i+j+1$  is odd. Since  $m = 2^p$ , so we have  $\gcd(2m, i+j+1) = 1$ . So,  $j-i = k' * 2m, k' \in Z$ . Since  $j-i \leq m-1 < 2m$ , so  $k' = 0$ . So we have  $i = j$ .

2) When one of  $i, j$  is even and the other is odd, then  $j-i$  is odd. Since  $m = s^p$ , so we have  $\gcd(2m, j-i) = 1$ . So,  $i+j+1 = t' * 2m, t' \in Z$ . Since  $1 \leq i+j+1 < 2m-1$ , so no such  $t'$  exists. Therefore, we cannot pick one odd and one even  $i, j$  such that  $(j-i)(i+j+1) = 2(k_1 - k_2)m$ .

We can get that if  $h(k, i) = h(k, j)$ , then  $i = j$ . So, the probe sequence  $\langle h(k, 0), h(k, 1), \dots, h(k, m-1) \rangle$  is a permutation of  $\langle 0, 1, 2, \dots, m-1 \rangle$ .
